APUA SET TO COMMISSION BARBUDA RO PLANT

The Antigua Public Utilities Authority is currently in the final stages of preparation for the commissioning of a new Reverse Osmosis plant in Barbuda. The plant will be officially commissioned by mid-May and will produce 100,000 imperial gallons per day. This plant will adequately meet Barbuda's consumption needs. The construction of the plant was funded through the ALBA Grant with additional funding coming from PDV Caribe. Given the higher cost for water production, Barbuda's water rates will mirror Antigua's.

The APUA Water Business Unit continues to work diligently on its plan to convert the nation to become 100% reliant on desalination.
